Note : The inner product $\cdot$ in $\mathfrak{g}$ is adjoint invariant

$$[X,Y]\cdot Z + Y \cdot [X,Z] = 0$$

and we are assuming $\{e^a\} \subset \mathfrak{g}$ is an orthonormal basis,

$e^a \cdot e^b = \delta^{ab}$. Suppose $[e^a, e^b] = \sum_c e^c f^{cab}$.

the structure constant.

Then, $e^a \cdot [e^b, e^c] = f^{abc}$

It is antisymmetric in $b \leftrightarrow c$ exchange, $f^{abc} = -f^{acb}$.

By the adjoint invariance of $\cdot$, we have

$[e^b, e^a]\cdot e^c + e^a \cdot [e^b, e^c] = 0$. i.e. $f^{cba} + f^{abc} = 0$.

$\Rightarrow f^{bac} = -f^{bca} = f^{acb} = -f^{abc}$.

I.e. f^{abc} is totaly antisymmetric in exchanges of a, b, c.

$\Rightarrow$ it is also cyclic invariant, $f^{abc} = f^{bca} = f^{cab}$.

Using this property of $f^{a_1 a_2 a_3} = e^{a_1} \cdot [e^{a_2}, e^{a_3}]$, we find

$$V^{\mu_1 a_1\, \mu_2 a_2\, \mu_3 a_3}_{k_1,\, k_2,\, k_3}$$

$$= \frac{i}{e^2} f^{a_1 a_2 a_3} \left\{ \delta^{\mu_1 \mu_2} (k_1 - k_2)^{\mu_3} + \delta^{\mu_2 \mu_3} (k_2 - k_3)^{\mu_1} + \delta^{\mu_3 \mu_1} (k_3 - k_1)^{\mu_2} \right\}$$

Some useful facts on simple Lie algebra $\mathfrak{g}$

$\{e^a\} \subset \mathfrak{g}$ as before $\left(\begin{array}{l} \text{an orthonormal basis wrt an adjoint inv} \\ \text{inner product } e^a \cdot e^b = \delta^{ab},\ [e^a, e^b] = \sum_c e^c f^{cab} \\ \rightsquigarrow f^{abc} \text{ totally antisymmetric} \end{array}\right)$

For any representation V of $\mathfrak{g}$

$$\mathrm{tr}_V(e^a e^b) = -T_V \delta^{ab}, \quad T_V \in \mathbb{R}_{\geq 0}$$

$\sum_a e^a e^a = -C_2(V)$: a scalar (quadratic Casimir) on each irreducible component

- If V is irreducible, $T_V \dim G = C_2(V) \dim V$
- $V = \mathfrak{g}$ (adjoint rep), $T_{\mathfrak{g}} = C_2(\mathfrak{g}) =: h^\vee$ is called the dual Coxeter number of $\mathfrak{g}$ for a suitable normalization of "$\cdot$".
- $\sum_b e^b e^a e^b = \underbrace{\sum_b e^b [e^a, e^b]} + \underbrace{\sum_b e^b e^b}_{-C_2(V)} e^a$

$$\sum_{bc} e^b e^c f^{cab} = \frac{1}{2} \sum_{b,c} [e^b, e^c] f^{cab} = \frac{1}{2} \sum_{b,c,d} e^d \underbrace{f^{dbc}}_{= -f^{bdc}} f^{cab}$$

$$= -\frac{1}{2} \sum_d e^d \underbrace{\mathrm{tr}_{\mathfrak{g}}(\mathrm{ad}\, e^d\, \mathrm{ad}\, e^a)}_{= -T_{\mathfrak{g}} \delta^{da} = -h^\vee \delta^{da}} = \frac{1}{2} h^\vee e^a$$

$$= \left(\frac{h^\vee}{2} - C_2(V)\right) e^a$$

$$\overset{V = \mathfrak{g}}{\rightsquigarrow} \sum_b \mathrm{ad}\, e^b\, \mathrm{ad}\, e^a\, \mathrm{ad}\, e^b = -\frac{h^\vee}{2} \mathrm{ad}\, e^a$$

We need to evaluate the integrals of the form

$$I(f) = \int \frac{d^4k}{(2\pi)^4} \frac{f(k)}{(k^2+m^2)((k-p)^2+\mu^2)},$$

polynomials of k^μ's

$$J(g) = \int \frac{d^4k}{(2\pi)^4} \frac{g(k)}{(k+q)^2\, k^2\, (k-p)^2},$$

which are often divergent. We shall employ the dimensional regularization in which these are replaced by

$$I_{DR}(f) = \mu_{DR}^{4-d} \int \frac{d^dk}{(2\pi)^d} \frac{f(k)}{(k^2+m^2)((k-p)^2+\mu^2)},$$

$$J_{DR}(g) = \mu_{DR}^{4-d} \int \frac{d^dk}{(2\pi)^d} \frac{g(k)}{(k+q)^2\, k^2\, (k-p)^2},$$

with $d = 4-\epsilon$ (eventually we take $\epsilon \to 0$). We use

$$\frac{1}{AB} = \int_0^1 \frac{dx}{[(1-x)A + xB]^2}$$

$$\frac{1}{ABC} = \int_{\triangle} \frac{2\,dy\,dz}{((1-y-z)A + yB + zC)^3}$$

where $\triangle := \{ (y,z) \in \mathbb{R}^2 \mid y \geq 0,\ z \geq 0,\ y+z \leq 1 \}$

Computation goes as follows

$$I_{DR}(f) = \mu_{DR}^{4-d} \int \frac{d^d k}{(2\pi)^d} \int_0^1 \frac{dx\, f(k)}{\big(\underbrace{(1-x)(k^2+m^2)+x((k-p)^2+\mu^2)}\big)^2}$$

$$k^2 - 2xpk + xp^2 + (1-x)m^2 + x\mu^2$$

$$= (\underbrace{k-xp}_{\ell})^2 + \underbrace{x(1-x)p^2 + (1-x)m^2 + x\mu^2}_{\Delta}$$

$$= \int_0^1 dx\, \mu_{DR}^{4-d} \int \frac{d^d \ell}{(2\pi)^d} \frac{f(\ell+xp)}{(\ell^2+\Delta)^2}$$

- We expand $f(\ell+xp)$ in ℓ^μ's, drop odd power terms and replace even power terms by a function of ℓ^2

  $f(\ell+xp) \to \tilde{f}(\ell^2, xp)$. (e.g. $\ell^\mu \ell^\nu \to \frac{1}{d}\delta^{\mu\nu}\ell^2$)

- Use $\displaystyle\int \frac{d^d\ell}{(2\pi)^d} F(\ell^2) = \frac{Vol(S^{d-1})}{(2\pi)^d} \int_0^\infty \ell^{d-1} d\ell\, F(\ell^2)$

$$= \frac{Vol(S^{d-1})}{2(2\pi)^d} \int_0^\infty \ell^{d-2} d\ell^2\, F(\ell^2)$$

$$= \frac{1}{(4\pi)^{d/2}\Gamma(d/2)} \int_0^\infty t^{\frac{d}{2}-1} dt\, F(t)$$

$$I_{DR}(f) = \frac{\mu_{DR}^{4-d}}{(4\pi)^{d/2}\,\Gamma(d/2)} \int_0^1 dx \int_0^\infty \frac{t^{\frac{d}{2}-1}\,dt\;\tilde{f}(t, xp)}{(t+\Delta)^2}$$

We may use $\displaystyle\int_0^\infty \frac{t^{p-1}\,dt}{(t+\Delta)^{p+q}} = \frac{B(p,q)}{\Delta^q} = \frac{\Gamma(p)\Gamma(q)}{\Gamma(p+q)\Delta^q}$

In this way we find

$$I_{DR}(f) = \frac{1}{(4\pi)^2} \int_0^1 dx \left(\frac{4\pi\mu_{DR}^2}{\Delta}\right)^{2-\frac{d}{2}} \Gamma\left(2-\frac{d}{2}\right) \hat{f}$$

where $\Delta = x(1-x)p^2 + (1-x)m^2 + x\mu^2$ and

$$\hat{1} = 1, \qquad \widehat{k^\mu} = x p^\mu$$

$$\widehat{k^\mu k^\nu} = \delta^{\mu\nu}\frac{\Delta}{2-d} + x^2 p^\mu p^\nu$$

$$\widehat{k^\mu (k-p)^\nu} = \delta^{\mu\nu}\frac{\Delta}{2-d} - x(1-x)\,p^\mu p^\nu$$

$$\widehat{(k-p)^\mu (k-p)^\nu} = \delta^{\mu\nu}\frac{\Delta}{2-d} + (1-x)^2 p^\mu p^\nu$$

Similarly (exercise):

$$J_{DR}(g) = \frac{1}{(4\pi)^2}\int_{\triangle} dy\,dz \left(\frac{4\pi\mu_{DR}^2}{\Delta}\right)^{2-\frac{d}{2}} \frac{\Gamma(3-\frac{d}{2})}{\Delta}\,\hat{g}$$

where $\Delta = y(1-y)q^2 + z(1-z)p^2 + 2yz\,qp$ and

$$\hat{1} = 1, \quad \hat{k^\mu} = -y q^\mu + z p^\mu$$

$$\widehat{k^\mu k^\nu} = \delta^{\mu\nu}\frac{\Delta}{4-d} + (-yq^\mu + zp^\mu)(-yq^\nu + zp^\nu)$$

Note: $\Gamma(3-\frac{d}{2}) = (2-\frac{d}{2})\Gamma(2-\frac{d}{2}) = \frac{1}{2}(4-d)\,\Gamma(2-\frac{d}{2})$

$$\therefore J_{DR}(g) = \frac{1}{(4\pi)^2}\int_{\triangle} dy\,dz \left(\frac{4\pi\mu_{DR}^2}{\Delta}\right)^{2-\frac{d}{2}} \Gamma(2-\tfrac{d}{2})\,\hat{\hat{g}}$$

$$\hat{\hat{1}} = \frac{4-d}{2\Delta}, \quad \hat{\hat{k^\mu}} = \frac{4-d}{2\Delta}(-yq^\mu + zp^\mu)$$

$$\hat{\hat{k^\mu k^\nu}} = \frac{1}{2}\delta^{\mu\nu} + \frac{4-d}{2\Delta}(-yq^\mu + zp^\mu)(-yq^\nu + zp^\nu)$$
